

Discovery of Novel CARs for Solid Tumors Using Senti REVEAL™

A High Throughput Technology
Platform Comprising Pooled Screening,
Machine Learning, and Lab Automation

Nick Frankel, PhD
Associate Director, Gene Circuit Discovery
Senti Biosciences, Inc.

Senti Bio's Internal Programs Focus on Oncology, Partnering to Support Non-Oncology Indications

Program	Target/Disease Candidate	Preclinical	Early Stage Clinical	Late Stage Clinical	Collaborator
SENTI-202	AML, MDS and other blood cancers	 <div>Clinical Trial ID NCT06325748 https://www.clinicaltrials.gov/study/NCT06325748 Initial clinical data by YE 2024</div>			
SENTI-301A	HCC and other solid tumors	 <div>Enroll first patient in 1H 2024</div>			
Multiple Gene Therapy Programs	Eye, CNS and liver diseases				
Multiple iPSC Cell Therapy Programs	Regenerative medicine				

AML: Acute myeloid leukemia; MDS: Myelodysplastic syndrome; HCC: Hepatocellular carcinoma; CNS: Central nervous system

Senti's Gene Circuit Platform to Enable Next-Gen Cell and Gene Therapies

Platform Technology

Logic Gating

Multi-Arming

Regulator Dial

Smart Sensor

Example Implementation

Components and Variants

Multivalent CARs for heterogeneous targets

Inhibitory CARs for reducing off-target

Potent CAR signaling domains

Calibrated Release (cr) system

Potent immune-activating payloads

Multi-payload combinations

Payload expression induced by FDA approved drugs at physiological levels

High sensitivity safety/kill switches

Tissue and cell type specific promoters

Cell activation inducible promoters

Potent constitutive promoters

SENTI-202: Logic-Gating and Multi-Arming to Address Clinical Needs in AML

Calibrated release of IL-15 for persistence

Logic gating for efficacy and safety

Protecting HSCs without compromising efficacy

Precision killing in vivo

Senti's Discovery and Optimization Engine for Novel Protein and DNA Assets

Senti REVEAL™

Research Engine for Validation
of Engineered Asset Libraries

REVEAL can be used to discover and optimize novel sequences of **both nucleic and amino acids** and is cell type agnostic.

High-Throughput Engineering of Enhanced Constitutive Promoters to Drive Multi-Payload Constructs for Next-Gen Cell Therapies

Challenge: driving expression of 4 therapeutic payloads from a single promoter in NK cells

- A. Secreted cytokine
- B. Calibrated release cytokine
- C. activating CAR
- D. inhibitory CAR

Senti REVEAL with three iterative design cycles and tens of thousands of promoters.

Start-to-finish under 9 months

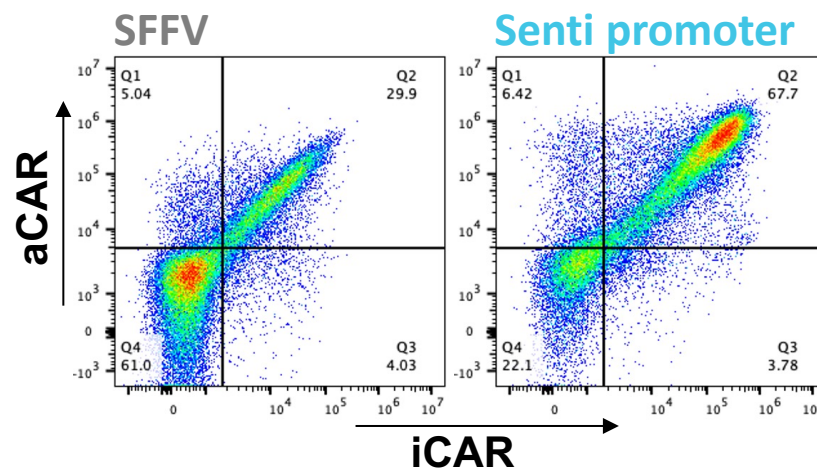

Automated clonal validation

100s of candidates validated in parallel
Models predict robust hits at a high rate

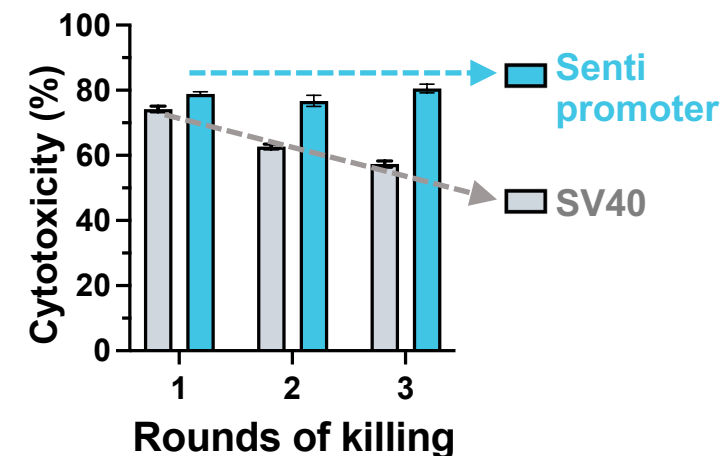

Enhanced multi-payload expression

Showing payloads 3 and 4. Payloads 1 and 2 also higher.
2-4x higher expression than SFFV or SV40

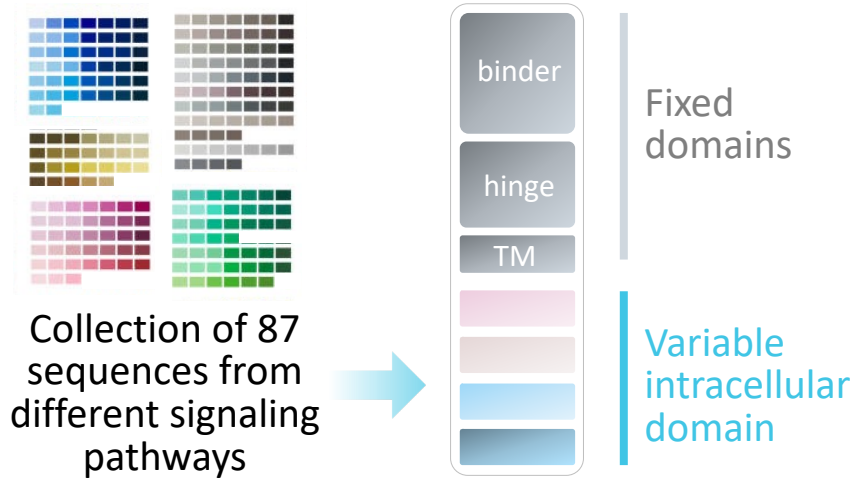

Expression drives performance

Persistence in serial re-challenge in vitro
killing assay (solid tumor cell line)

Discovery of Novel CAR Signaling Domains for Tackling Solid Tumors by Screening Libraries of Tens of Thousands of CAR Signaling Domains

CAR Library Design

- ✓ Intracellular domains are combinatorial assemblies containing from 1 to 5 subdomains
- ✓ Subdomains sizes range from isolated motifs <10 AA to full-size domains >300 AA
- ✓ Increased diversity by building multiple sub-libraries with different design principles and assembly methods
- ✓ **Over 50,000 CARs in total, works with T or NK cells**

Illustrative diagram, not drawn to scale

Sort-seq Workflow

Transduce CAR library into immune cells and challenge with target cells

Sort activated from non-activated immune cells and sequence CARs

HTS Results (sub-library)

>100 significant CAR hits above the CD28z benchmark

Bioinformatics platform

predicted structures

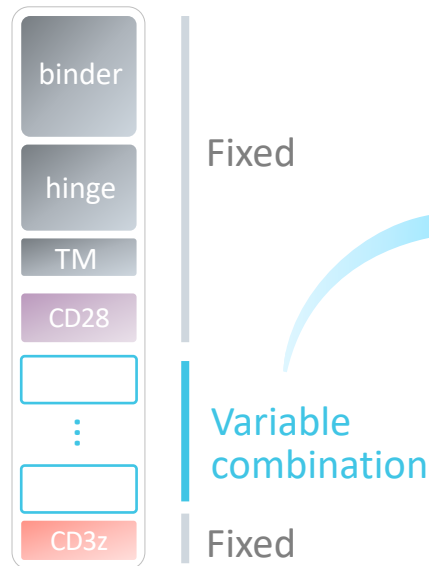

Clonal validation

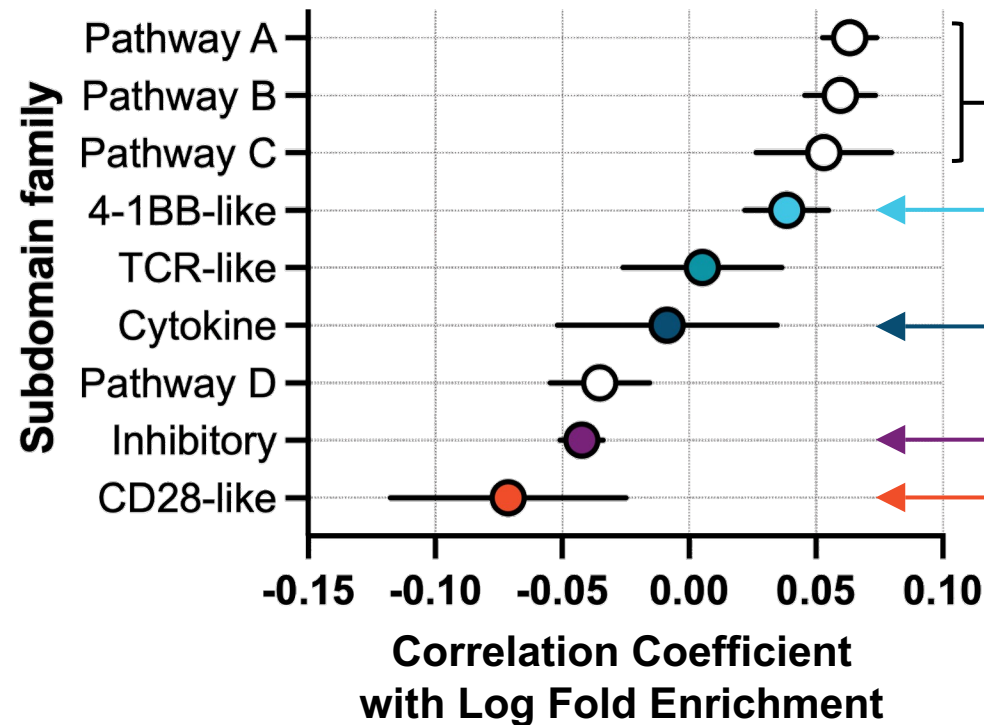

Certain Subdomain Families Are Enriched in High Performing CAR Intracellular Domains in the Context of a 3rd Generation CAR architecture

Trends at the sub-library level

Sub-library with fixed CD28 and CD3z plus variable domain (3rd gen)

Summary of CAR performance by subdomain family

Mean +/- standard deviation across all sequences in family and across all positions. Correlation of each sequence in each position is calculated over all combinations in sub-library.

Take-homes

Novel costimulatory subdomains from alternate families

TRAF-binding adds to efficacy to make a classical 3rd gen architecture

Some CARs successfully combine canonical signals 1, 2, and 3

Negative controls inhibit function

Poor performance likely because CD28 is already in the fixed region

Clonal Validation Using Automated Liquid Handling

Individual hit validation

Degranulation (CD107a)

~50% hit validation rate using the same assay used as in the pooled screen sort-seq protocol.

24 hours, 1:4 E:T ratio, flow cytometry readout

Cytotoxicity (Solid tumor cell line)

Top CAR exhibits >50% higher cytotoxicity than CD28z in killing a solid tumor cell line

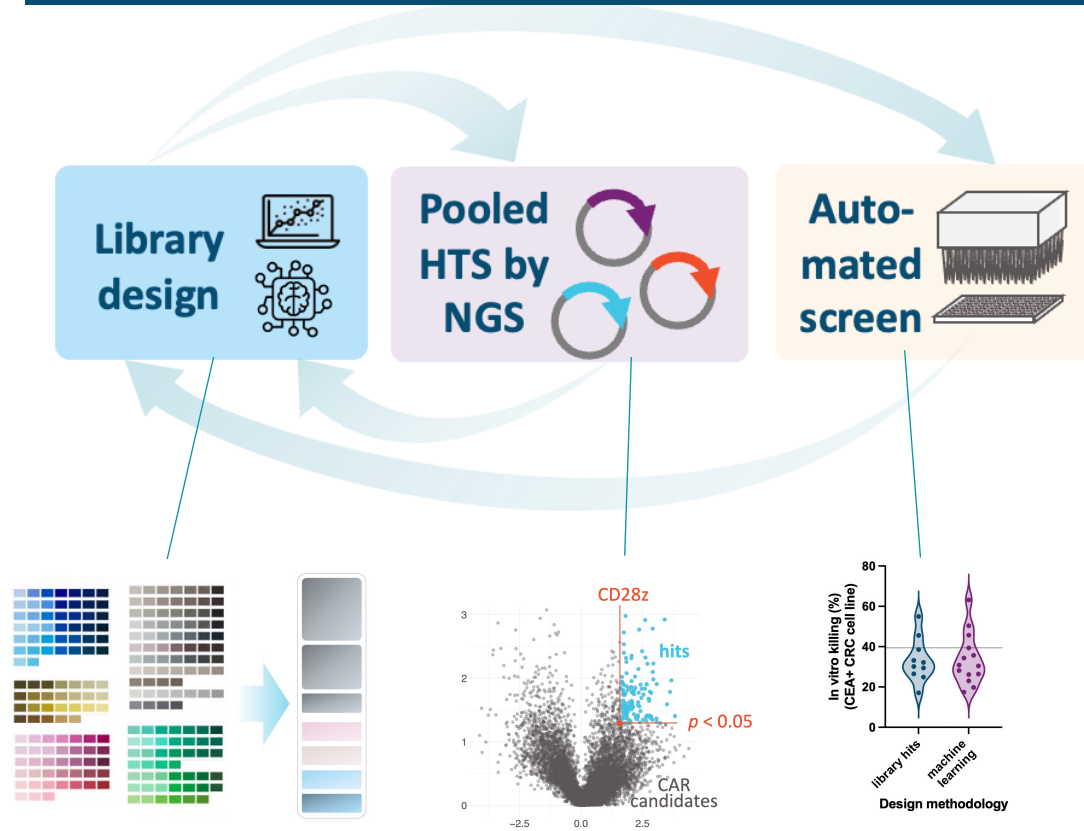

72 hours, 1:4 E:T ratio, imaging readout

Design Method

ML model trained on HTS data predicts potent CARs.

Discovery of novel potent CARs using Senti's REVEAL™ platform

- Senti's gene circuit platform includes potent and specific promoters, logic-gated CARs, calibrated release cytokines, and inducible systems.
- Our discovery engine, REVEAL, combines pooled screening, machine learning, and automated liquid handling
- We used REVEAL to discover CARs with greater degranulation, cytotoxicity, and cytokine release (not shown) than CD28z, but with novel structures.
